Maya Mahmoud

FULL-STACK WEB DEVELOPER

PROFILE

Full-Stack Web Developer with a strong foundation in Laravel, PHP, MySQL, Angular and modern web development, with production experience delivering a multi-tenant SaaS for a commercial client. I take a system the whole way rather than one layer of it: I produce the requirements analysis first — scope, roles, access rules and business rules — then build the backend and the frontend, and deploy the result to a live domain myself. Focused on writing clean, maintainable, well-tested code, with particular interest in the parts of a system that are hard to undo: auditability, role-based access control, and data isolation between tenants.

EDUCATION

B.Sc. in Electronics and Communications Engineering 2021 – 2026

Tishreen University, Latakia, Syria

- Graduation project: UniSmart, a smart university management platform with an AI teaching assistant — designed and built solo.

TECHNICAL SKILLS

Backend	PHP, Laravel | MySQL, Eloquent ORM | REST API Design | Multi-Tenancy & Data Isolation | Role-Based Access Control | Audit Logging | Relational Data Modelling | Node.js
Frontend	Angular 17 (Standalone Components, Signals, RxJS) | TypeScript | React.js | JavaScript | Tailwind CSS | Alpine.js | Livewire | Angular Material | Bootstrap | HTML5, CSS | Internationalisation (Arabic / English, RTL)
Business Analysis	Requirements Gathering & BRD Authoring | Business Process & Use-Case Modelling | Business Rules Definition | Permission Matrix Design | MoSCoW Prioritisation | Acceptance Criteria & Scope Control
Testing & Tools	PHPUnit, Automated Feature Testing | Git, GitHub | Postman | Composer, npm
Deployment	cPanel Shared Hosting | Apache, .htaccess Rewrite Rules | Production Builds & Environment Configuration | Domain & HTTPS Setup | MySQL Database Deployment
Integrations	LLM Integration (Groq, Gemini) | PDF Text Extraction | QR Code Integration

PROJECTS EXPERIENCE

Customer Loyalty Platform — Multi-Tenant SaaS Jun 2026 – Present

Freelance Full-Stack Developer & Business Analyst — Al-Anzima Al-Mutajadida, Damascus, Syria

Angular 17 · Laravel 12 · MySQL · Tailwind CSS · PHPUnit · cPanel

↗ github.com/Maya-Mahmoud/Customer_Loyalty_Platform

▶ **Customer Loyalty Platform — Video Demo**

- Authored the requirements document before any code was written — scope, the four user roles and their permission matrix, the business rules, and the core processes prioritised with MoSCoW — then implemented the system end to end.
- Built a multi-tenant architecture with complete data isolation, so no shop can reach another shop's customers, invoices, or reports through any request path.
- Designed customer point balances as values derived from an immutable ledger of entries rather than a stored total, making every balance reconstructable and defensible when a customer disputes it.
- Developed a fully configurable loyalty rules engine — threshold type and value, reward type, discount cap, minimum qualifying invoice, cross-branch accrual, reset policy and expiry — with historical versioning so a rule change never applies retroactively.
- Implemented twelve anti-fraud controls against internal collusion, including duplicate-invoice constraints, blocking of staff phone numbers, cancellation-pattern detection, and separation of recording from approval.
- Built a no-account customer lookup: the customer reads their own balance by choosing the shop and entering their phone number with details from a receipt they hold — proof of purchase in place of a password, so nothing has to be issued, stored or reset, which removes the main adoption barrier for loyalty programmes in this market.
- Covered role permissions, tenant isolation, ledger correctness and money-handling edge cases with automated feature tests, and delivered a bilingual Arabic/English interface with full RTL support.
- Deployed and now maintain the system in production on cPanel shared hosting: Laravel API and database setup, Angular production build, HTTPS on a live domain, Apache rewrite rules for client-side routing, and asset cache headers — the system is live and currently being piloted by its first shops.

Electronic Archiving & Document Management System

Technical Assessment — Full-Stack Developer & Business Analyst — Al-Anzima Al-Mutajadida, Damascus, Syria

Laravel 12 · PHP 8.2 · MySQL · Tailwind CSS · Alpine.js

↗ github.com/Maya-Mahmoud/archive

- Produced the requirements analysis before development — system scope, user roles, access rules and document workflows — and used it as the reference for implementation.
- Built a custom role-based access control system — per-role permission sets enforced at route, controller and interface level — so administrators can create new roles without code changes.
- Stored documents on private storage under UUID file names, served only through permission-checked routes, with configurable file-type and size validation.
- Implemented a full audit trail of logins, views, uploads, downloads, deletions and settings changes, recorded with IP address and device.
- Added per-category retention policies enforced by a daily scheduled job using soft deletes, and collision-safe automatic document numbering.

- Delivered live search and filtering across document metadata, and a responsive bilingual Arabic/English interface with full RTL support using Tailwind CSS and Alpine.js.

UniSmart — Smart University Management System

Graduation Project — Solo Full-Stack Developer — Tishreen University, Latakia, Syria

Laravel 12 · PHP 8.2 · MySQL · Livewire 3 · Tailwind CSS · Groq API (Llama 3.3)

↗ github.com/Maya-Mahmoud/ManagementSystem

▶ **UniSmart — Video Demo**

- Designed and built solo a university platform for students, professors and administrators, replacing paper attendance sheets with electronic QR attendance.
- Built QR attendance end to end: the professor generates a code, students scan it with their phone, and the server verifies each student belongs to the lecture's department, year and semester; a database-level unique key prevents duplicate records.
- Integrated Veloria, an AI teaching assistant on the Groq API (Llama 3.3): text is extracted from lecture PDFs on upload, so a student who missed a class picks the lecture and gets an explanation without waiting for files to process.
- Built AI quiz generation for professors from selected lectures, with automatic grading on submission and one-click export of results.
- Developed hall booking for extra sessions and exams — enter a time range, see only free halls, book — using a single overlap rule shared by lectures, bookings and availability search to prevent double-booking; recurring lectures daily, weekly or monthly.
- Automated time-based work with scheduled and queued jobs: reminders to students a day before and to professors 30 minutes before each lecture, and absence alerts above 55%, with attendance reports exported to CSV.
- Built on Laravel MVC with Livewire, Eloquent ORM and MySQL, with role-based access for three roles and two-factor authentication.

CERTIFICATIONS

Mastering Laravel Framework and PHP 2025

- Laravel, PHP, Eloquent ORM, authentication and API development, with hands-on work building scalable applications. Certificate: coursera.org/verify/WZLGEPE4JS9

Web Design 2023

- UI/UX design, responsive layouts, HTML, CSS and modern web styling, applied to Laravel Blade templates and frontend integration.
